

**Lake Powell Pipeline Project
FERC Request for Clarification Schedule A – Item 7**

Exhibit E

Aesthetic Resources

7. In section 4.1 of Final Study Report 16, you eliminated the analysis of potential effects of project lighting on the night sky because you plan to use motion-sensitive switches to turn the lights on only during, “operational activities” or “potential security issue[s].” However, in appendix B of Final Study Report 9, you say the nighttime lighting would either be manually controlled or programmed. Please clarify whether all project lighting would use motion-sensitive switches. If any sites would be constantly illuminated, then provide an analysis of potential effects on the night sky consistent with Study Plan 16.

UBWR Response:

All LPP project surface facilities and features would use motion-sensitive switches for outdoor lighting to activate lights only during operational activities or potential security issues.
